Branch Cleanup on Copado

KB0103288 - v2.0 (Outdated)

☆☆☆☆ 4 views

Overview

Copado's branching strategy creates feature and promotion Git branches to move changes across your pipeline and keep all org branches in sync. Over time, this can result in a considerable number of branches, especially if developers tend to validate and promote often.

Even though the number of branches does not have a significant impact on the size of your repository, reducing the number of branches will help improve the repository navigation as well as gain efficiency.

This article provides the overview of the Branch Cleanup automation job setup on the Copado Platform.

How these Branches will be removed ?

E3 team has setup an automated Job to perform Branch cleanup per org on ADO platform. The branch clean up job cleans up Orphan, Feature & Promotion branches on ADO Platform.

As part of branch cleanup process, there will be NO impact to the Salesforce user stories

By default, branch cleanup process will delete specific branches which are 90 days or old. If in any case, your org requires a different criteria and have a valid use case for it, same job can be customized for your specific need.

Frequency - 1st of every month

Please create an intake request via go/csd (<https://go/csd>).
