Understanding Copado Core DevOps

Our **Worker-Based** Backend Architecture

Copado's Multi-Tenant, Secure Transaction Engine

Our Current Heroku-based Backend

Our New CopaGCP Backend

CopaGCP: An Extensible Infrastructure

CopaGCP Core DevOps Backend - “Under the Hood”

- Retains “Worker-based” Application Architecture
- Auto-Scales to meet Increased Demand
- Finite Worker Resource Control, to Help Performance
- Built on Robust, Secure Google Cloud Services

#1 Native DevOps for Salesforce

Question:

Are there any key differences when it comes to security [on CopaGCP]?

Yes. Security Controls in CopaGCP are **Explicit and Extensive**, where as the Security Controls in Heroku are *Implicit* and managed by Salesforce.

CopaGCP Security Controls Overview

- Inherit Google Cloud Platform **FedRAMP-caliber Controls** (based on NIST 800-53)
- Ingress/Egress Controls:
 - Google **Cloud Armor** (Enterprise-grade DDoS Defence, OWASP Top 10 Mitigation, WAP)
 - Google **Cloud Anomaly Detection** (Outbound intrusion, Crypto Mining, Unusual Activity)
 - Google **Security Health Analytics**
 - **Cloud DNS with DNSSEC**
 - **Event Threat Detection** (Active Security Log Monitoring, Malware, Brute Force SSH)
- Container Security Controls:
 - **Container Analysis** (Continuous Vulnerability Scanning, CVSS 3.0 based analysis)
 - **AV & FIM** (File Integrity Management) on **K8s Nodes and Storage**
 - **Container Threat Detection** (Added Binary Executed, Loaded, Reverse Shell)

CopaGCP

Q: Where is CopaGCP Deployed & Available?

Built using “Infrastructure-as-Code” technologies, **CopaGCP** replicas are deployable in a fraction of the time it would take with traditional Infrastructure.
