This Article on Back Promotion Checker helps us with step by step process on dealing with pending Back Promotions with guided screens for the workflow.

This Article helps us with step by step process on Copado best practices on dealing with pending Back Promotions with guided screens for the workflow.

Back Promotion Enforcer/Checker extension Overview :

This solution allows you to enforce best practices and help customers get into the discipline of back promotion continuously.

It is a good practice to prevent promotions to be completed if the target environment is not in sync. If there are pending back promotions in the destination, the promotion will not be done and an error message will be displayed.

Implemented for classic and 2nd gen pipelines.

1. Configuration

E3 Copado team is responsible for the Back promotion checker configuration. We also configured the quality gate to pass custom conditions for the extension to be active. We have a custom flow created and is active to count number of Back promotions.

Quality gate conditions:

E3 Copado team will handle the custom conditions based on the respective team. Take a look below to see which custom conditions to pass.

1. You can enable/disable the quality gate to a respective pipeline.
2. You can select which env should be enabled for the Back Promotion checker.

Note : We are enabling this back promotion checker on the User Story level.

Use Cases:

Below screenshot shows one of our test pipeline where back promotion checker is enabled for all the environments,

You can see there are 9 pending back promotions from UAT to DEV2 in the above screenshot. Which indicates DEV1 and DEV2 are not in sync.

Now take a User Story created in DEV2 and all checks are passed. Now when you try to deploy from DEV2 to SIT, **Back promotion checker will block the promotion** as below

A screenshot of a Salesforce error message. At the top, a red banner with a white 'X' icon contains the text 'We hit a snag.' Below this, a section titled 'Review the errors on this page.' contains a single bullet point. The bullet point text reads: 'We can't save this record because the "BackPromotion Check Before Promotion (classic)" process failed. Give your Salesforce admin these details. An Apex error occurred: copapromocheck.FlowCustomError.CustomException: You cannot promote because there are back-promotions pending Error ID: 1183414826-98280 (2043697736)u cannot promote because there are back-promotions pending Error ID: 1183414826-98280 (2043697736)'. The text 'You cannot promote because there are back-promotions pending Error' is highlighted in yellow.

Steps to follow before we enable the Quality gate:

1. Reach out to E3 Copado team to include/exclude pipelines/envs for the quality gate check with justification.
2. Provide us the info to keep the back promotions in a respective environment, so E3 copado team can create new custom conditions accordingly.
3. We setup the count for number of Back promotions to **"10"**. If your pending back promotions exceed this count, you will be unable to promote a User Story to next environment until you clear the pending back promotions.
4. Keep environments in sync to avoid environment/branch refresh.
