The document provides steps on How to Handle Azure Bug type (Work item type) on Copado Platform

Overview

This Knowledge article provides a brief overview on how a Developer should be handling a Work item type as Bug on Copado Platform.

If incase, Developer wants to move a change as part of Bug, one should create a User Story for the respective bug in Azure Board and then Sync User story on the Copado (same procedure to be followed as incase of regular User Story). Then commit bug fix changes to this User Story and move the it along the pipeline as User Story record type.

NOTE - Downstream application such as "GLAPI"/ "Quality API" doesn't expect changes to be promoted to higher life cycle as a Bug type. It always needs to be tracked to a User story and which gets tracked to the Requirements. Hence We don't recommend using Bug Type for promoting changes in Copado.

For more details on syncing user story from ADO to Copado, Please visit - [Sync User Stories \(https://humanaprod.service-now.com/kb_view.do?sysparm_article=KB0100181\)](https://humanaprod.service-now.com/kb_view.do?sysparm_article=KB0100181)
